This document is intended to be used by a factory trained and qualified heating contractor or service technician only. Read all Instructions within this document and within the relevant Boiler Installation and Maintenance Manual before proceeding. It is recommended to follow the procedures in the steps given. Skipping or missing procedural steps could result in substantial property damage, serious injury, or death.

PRODUCT AND SAFETY INFORMATION

IMPORTANT SAFETY INFORMATION

Triangle Tube accepts no liability for any damage, injury, or loss of life resulting from incorrect installation, alteration of any factory supplied parts, or the use of parts or fittings not specified by Triangle Tube. If there is a conflict or doubt about the proper installation of the unit or any factory supplied replacement parts please contact Triangle Tube Technical Support.

DEFINITIONS

The following terms are used throughout this manual to bring attention to the presence of potential hazards or to important information concerning the product.

**DANGER**
Indicates the presence of a hazardous situation which, if ignored, will result in substantial property damage, serious injury, or death.

**WARNING**
Indicates a potentially hazardous situation which, if ignored, can result in substantial property damage, serious injury, or death.

**CAUTION**
Indicates a potentially hazardous situation which, if ignored, can result in minor property damage, or injury.

**NOTICE**
Indicates special instructions on installation, operation or maintenance, which are important to the equipment but not related to personal injury hazards.

**BEST PRACTICE**
Indicates recommendations made by Triangle Tube for the installers, which will help to ensure optimum operation and longevity of the equipment.

**WARNING**
This document is intended to be used by a factory trained and qualified heating contractor or service technician only. Read all instructions within this document and within the relevant Boiler Installation and Maintenance Manual before proceeding. It is recommended to follow the procedures in the steps given. Skipping or missing procedural steps could result in substantial property damage, serious injury, or death.

**NOTICE**
This Control Application Supplement applies to CTRLMax controls with the following software version numbers:

**PRESTIGE and HEATMASTER TC:**
Display SW v.4.03 & v.4.04
Burner Controller SW v.0.53 & v.0.54

**INSTINCT:**
Display SW v.0.23 and up
Burner Controller SW v.0.54

The software version numbers are displayed on the initial screen after turning on the unit.
CHAPTER 1 - OPERATING INFORMATION

1.1. General
The ControlMax (CTRLMax) system control is designed to be flexible yet easy to use. It monitors and controls the boiler to operate as efficiently as possible. CTRLMax monitors the appliance supply, return and flue gas temperatures and operates the ignitor, gas valve and blower. It uses this information to modulate the appliance firing rate to maintain the required setpoint. CTRLMax offers many advanced control options, which may be adjusted for various applications to achieve optimum appliance efficiency and operation:

- Two central / space heating (CH) call inputs with separate outdoor curves.
- A Domestic Hot Water (DHW) call input with optional priority.
- System temperature sensing and control with an optional system temperature sensor.
- A cascade function (Prestige and Instinct Solo appliances only). It allows, for example, up to six boilers to operate together in a single heating system.
- A Modbus interface for integrating with building management systems.

Accessing the functions is done through the user interface, that presents itself in two different versions:

1.1.1 PRESTIGE and HEATMASTER Control Panel Description

1. CTRLMax LCD Display - It is the setup interface of the appliance and indicates the parameter values, the error codes and the set-up status of the parameters. It displays a series of screens, each showing information and/or icons.

2. Installer button - Allows the installer to open the access code window of the CTRLMax controller and set up the system once the code has been entered.

3. Arrow keys and OK key - To browse through the screens of the CTRLMax controller, set up the appliance, increase and decrease the displayed values and validate the selections. The OK key is also used to RESET the appliance after a blocking (following the instructions on the screen).

1.1.2 Main settings of the PRESTIGE and HEATMASTER CTRLMax Display

Screen backlight - it will illuminate when any key is depressed, and remain illuminated for five minutes.

Screen contrast - it can be adjusted at the Home screen by pressing and holding the OK key, then pressing and holding the LEFT key along with the OK key. Press the UP and DOWN key to increase or decrease the contrast while holding the OK and LEFT keys depressed. All keys must be released and the procedure performed again to switch between increasing and decreasing contrast.

Fig. 1 - PRESTIGE and HEATMASTER Control Panel
CHAPTER 1 - OPERATING INFORMATION

1.1.3 INSTINCT Control Panel Description

1. CTRLMax LCD Display - It is the setup interface of the appliance and indicates the parameter values, the error codes and the set-up status of the parameters. It displays a series of screens, each showing information and/or icons.

2. Installer function - By touching simultaneously the up and down arrow keys for 3 seconds, the installer can open the access code window of the CTRLMax controller and set up the system once the code has been filled in.

3. Arrow soft keys and OK/Reset key - To browse through the screens and menus of the CTRLMax controller, set up the appliance, increase and decrease the displayed values and validate the selections. The OK/Reset key is also used to RESET the appliance after a blocking (following the instructions on the screen).

4. On-Off soft key - To shut down the unit.

DANGER

When touching the soft key, the unit shuts down but is not isolated from power supply. Therefore, live current is still present in the unit. For your safety, disconnect electrical power supply to the unit before servicing or making any electrical connections to avoid possible electric shock hazard. Failure to do so can cause serious injury, or death.

NOTICE

- When shutting down using the soft key, the appliance will not react to any heat demand. However, the basic appliance protection functions (such as frost protection, etc.) remain active.

- In addition, the arrow soft keys are no longer illuminated, and the soft key lighting is dimmed.

The CTRLMax navigation is performed through soft keys that react to the touch and emit a short beep when tapped.

NOTICE

Exert a light and short touch (tap) on the soft keys to activate their function. Holding the touch too long will not generate any reaction from the CTRLMax, unless it is a combination of soft keys meant to be touched simultaneously for a determined duration, as instructed in this manual. The arrow keys can also be held longer to increase or decrease values faster.

Navigation through the menus and selection of items/ modification of values is performed through four arrow soft keys. The center soft key is used for validation (and for Reset in some cases).

The installer is provided with full access to all available features after simultaneously touching the and soft keys for 3 seconds and entering a code.
CHAPTER 1 - OPERATING INFORMATION

The Main Menu (EZSetup, no code required) can be accessed from the Home Screen by touching the center soft key. More information can be found in the Installation manual of the INSTINCT units.

To shut down the unit, touch the soft key.

⚠️ DANGER ⚠️

When touching the soft key, the unit shuts down but is not isolated from power supply. Therefore, live current is still present in the unit. For your safety, disconnect electrical power supply to the unit before servicing or making any electrical connections to avoid possible electric shock hazard. Failure to do so can cause serious injury, or death.

NOTICE

• When shutting down using the soft key, the appliance will not react to any heat demand. However, the basic appliance protection functions (such as frost protection, etc.) remain active.

• In addition, the arrow soft keys are no longer illuminated, and the soft key lighting is dimmed.

1.1.4 Main settings of INSTINCT CTRLMax Display

The Home Screen presents status information in a very user friendly way so that the current state of the boiler can be quickly accessed.

• Screen backlight - it will illuminate when any soft key is touched, and remain illuminated for five minutes.

• Screen brightness - it can be adjusted at the Home screen by touching and holding simultaneously the and soft keys for 2 seconds. Touch the and soft key to increase or decrease the contrast. Touch to end the process.

1.1.5 Main Icons of CTRLMax display

- Central Heating - indicates information related to the CH circuit.
- DHW - indicates information related to the Domestic Hot Water circuit.
- Home - to go back to the main menu screen.
- Back - to go back to the previous screen.
- Pump - indicates a pump is operating.
- Warm weather shutdown - displays on the home screen when the outdoor temperature reaches the Warm Weather Shutdown preset temperature.

1.2 Installer Access Code

By pushing the installer button (PRESTIGE/HEATMASTER TC), or touching simultaneously the and soft keys for 3 seconds (INSTINCT), the access code window opens, where the installer can enter the specific code “054”. Subsequently, the installer can access various setup screens and menus, allowing to define a large set of parameters and adapt the operation of the CTRLMax to the system configuration.

To navigate on the screen, use the UP, DOWN, LEFT and RIGHT keys, then the OK key to validate a selection. To increase/decrease values, use the UP and DOWN or LEFT and RIGHT keys, according to the situation and validate with OK.

NOTICE

Entering the installer access code allows the installer to make adjustments for 30 minutes. After 30 minutes, the access code will need to be entered again to make any adjustments.

If the end user misuses the installer code to access installer-specific parameters and makes changes that cause a system failure, any warranty claim will be void.
CHAPTER 1 - OPERATING INFORMATION

1.3. CTRLMax Installer Menu Structure

The Installer Menu is divided into four sections:

- **CH & DHW Settings** – Allows the installer to adjust the appliances central/space heating and domestic hot water settings for the application.

- **Manual Operation** – The burner and circulators can be manually enabled for testing.

- **Cascade** – Allows the installer to setup, adjust and monitor the Cascade System.

- **Reset All Settings** – Resets all CH, DHW, and Cascade Settings back to the default settings.

---

**PRESTIGE / HEATMASTER**

Boiler Protection

** ENTER ACCESS CODE **

05[4]

Select a position using the LEFT and RIGHT keys, and increase or decrease the digit value using the UP and DOWN keys. Then the OK key to validate.

**CH Settings**

**CH & DHW Settings**

**Reset All Settings**

Press OK to restore factory settings, any other button to keep current settings.

**Manual Operation**

- The burner and circulators can be manually enabled for testing.

**Cascade**

- Allows the installer to setup, adjust and monitor the Cascade System.

**Reset All Settings**

- Resets all CH, DHW, and Cascade Settings back to the default settings.
CHAPTER 2 - CH SETTINGS

Installer Code

CH & DHW Settings

CH Settings

Heating Settings

Heating Operation

Demand Type

Heating Operation allows the central heating function to be enabled and disabled.
Select Enabled or Disabled using the UP or DOWN keys, then store the setting with the OK key.

Enabled - The Appliance will respond to a central heating call.

Disabled - The Appliance will not respond to a central heating call.

The heating operation disabled icon (▔) is displayed on the home screen when central heating operation has been disabled.

NOTICE

When heating is disabled the frost protection will still be active.

Default: Enabled

Demand Type allows the installer to select how a CH Demand is generated.
Select the CH Demand Type using the UP or DOWN keys, then store the setting with the OK key.

Default: Thermostat and Outd. Curve

See detail of menu on next page.
CHAPTER 2 - CH SETTINGS

Demand Type screen menu

Thermostat & Outdoor Curve – A central heating call from a dry contact switch will enable the appliance and the setpoint will vary with the outdoor temperature for central heating calls.

Thermostat & Setpoint – A central heating call from a dry contact switch will enable the appliance and the setpoint will be fixed for central heating calls.

Constant & Outd. Curve – The appliance will maintain setpoint and the central heating circulators will be constantly enabled without an external call from a dry contact switch. The central heating circulators will be disabled when the outdoor temperature exceeds the Warm Weather Shutdown Temperature setting. The setpoint will vary with the outdoor temperature for central heating calls.

Constant & Setpoint – The appliance will maintain setpoint and the central heating circulators will be constantly enabled without an external call from a dry contact switch. The central heating circulators will be disabled when the outdoor temperature exceeds the Warm Weather Shutdown Temperature setting. The setpoint will be fixed for central heating calls.

0 - 10V Modulation Signal – This option allows the appliance firing rate to be controlled by an external control system with a 0-10 VDC signal. Based on the control input voltage, the appliance will start to operate for heat demand. The CH temperature is limited by the Absolute maximum temperature.

• 0 – 2V appliance is off.
• 2 – 10 V linear power increase from minimum to maximum output.
• 10 – 2 V linear power decrease from maximum to minimum output.
• 2 – 1 V appliance on minimum capacity.
• 1 - 0 V appliance off.

CH Settings

Heating Settings

Heating Operation Enabled

Demand

Thermostat & Outdoor Curve

Constant & Outdoor Curve

Constant & Setpoint

0 - 10V Modulation Signal

CH Maximum Capacity

CH Maximum Capacity limits the maximum CH capacity. The appliance capacity can be defined by adjusting this value. 100% means Maximum CH output, 0% means minimum CH output. It is therefore possible to adjust the CH capacity to the installation needs.

Example: when set to 60%, the real appliance capacity is the appliance minimum capacity plus 60% of the difference between the maximum and minimum capacity.

Adjust the CH Maximum Capacity value using the LEFT or RIGHT keys to then store the setting with the OK key.

Default: 100%
**CHAPTER 2 - CH SETTINGS**

**Heating Settings**
- **Heating Operation**: Enabled
- **Demand**: Thermostat & Outd. Curve
- **CH Maximum Capacity**: 100%
- **CH Minimum Capacity**: 0%
- **Abs. Max CH Setpoint**: 186°F
- **CH1 Max. Setpoint**: 180°F
- **CH1 Min. Setpoint**: 80°F

**CH Minimum Capacity** sets the lowest limit of the CH capacity. The appliance capacity can be defined by adjusting this value and the CH Maximum capacity. It is therefore possible to adjust the CH capacity to the installation needs.

Example: when the CH minimum capacity is set to 20%, the real appliance capacity is the appliance minimum capacity plus 20% of the difference between the maximum and minimum capacity.

Adjust the CH Minimum Capacity using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 0%

**Absolute Max CH Setpoint** limits the setpoint during a central heating call. This setting can be used to prevent a user from adjusting the central heating setpoint or outdoor curve above a safe operating temperature in the EZ Setup Menu. A warning screen will be displayed in EZ Setup if the user attempts to raise the setpoint above the Absolute Max CH Setpoint. The Absolute Max CH Setpoint will be displayed on the outdoor curve in EZ Setup if the user selects an outdoor curve which goes above the Absolute Max CH Setpoint.

Adjust the Absolute Max CH Setpoint using the LEFT or RIGHT keys to then store the setting with the OK key.

Default: 186°F

**CH1 Max. Setpoint** is the maximum setpoint for a CH1 heating call when an Outdoor Curve option is chosen in Demand Type. CH1 Maximum Setpoint is the fixed setpoint for a CH1 heating call when a Setpoint option is chosen in Demand Type.

Adjust the CH1 Maximum Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 180°F

**CH1 Min. Setpoint** is the minimum setpoint for a CH1 heating call when an Outdoor Curve option is chosen in Demand Type. This setting is not applicable when a Setpoint option is chosen in Demand Type. CH1 Min. Setpoint must be set equal or below the CH1 max. setpoint.

Adjust the CH1 Minimum Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 80°F
CHAPTER 2 - CH SETTINGS

Outdoor Curve Coldest Day is the coldest outdoor design temperature of the heating system when an Outdoor Curve option is chosen in Demand Type. This setting is not applicable when a Setpoint option is chosen in Demand Type.

Adjust the Outdoor Curve Coldest Day value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 10°F

Outdoor Curve Warmest Day is the warmest outdoor design temperature of the heating system when an Outdoor Curve option is chosen in Demand Type. This setting is not applicable when a Setpoint option is chosen in Demand Type.

Adjust the Outdoor Curve Warmest Day value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 64°F

CH2 Circuit allows the CH2 Max and Min setpoints to be enabled and disabled. When disabled, the boiler will not respond to a CH2 heating call.

Select Enabled or Disabled using the UP or DOWN keys, then store the setting with the OK key.

Enabled – The appliance will respond to a CH2 heating call using CH2 max and min setpoints.

Disabled – The appliance will not respond to a CH2 heating call using CH2 max and min setpoints.

Default: Enabled

CH2 Maximum Setpoint is the maximum setpoint for a CH2 heating call when an Outdoor Curve option is chosen in Demand Type. CH2 Maximum Setpoint is the fixed setpoint for a CH2 heating call when a Setpoint option is chosen in Demand Type.

Adjust the CH2 Maximum Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 140°F
### CHAPTER 2 - CH SETTINGS

- **CH2 Circuit Enabled**
- **CH2 Max. Setpoint**: 140°F
- **CH2 Min. Setpoint**: 80°F

**CH2 Minimum Setpoint** is the minimum setpoint for a CH2 heating call when an Outdoor Curve option is chosen in Demand Type. This setting is not applicable when a Setpoint option is chosen in Demand Type.

Adjust the CH2 Minimum Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 80°F

**Warm Weather Shutdown** allows to enter an optional outdoor temperature at which to disable the central heating function. The Appliance will continue to respond to a domestic hot water call or a 0-10V Modulation Signal when the outdoor temperature exceeds the Warm Weather Shutdown Temperature setting.

Adjust the Warm Weather Shutdown Temperature value using the LEFT or RIGHT keys, then store the setting with the OK key.

The Warm Weather Shutdown icon (ế) is displayed on the home screen when the outdoor temperature reaches the Warm Weather Shutdown Temperature.

Default: OFF

**Circulation Pump Permanent** allows the central heating circulators to be constantly enabled even without a central heating call. A domestic hot water call will cause the circulators to be disabled during the domestic call as long as DHW Priority is enabled.

Select **Enabled** or **Disabled** using the UP or DOWN keys, then store the setting with the OK key.

- **Enabled** – The central heating circulators will be enabled for constant circulation without a central heating call.
- **Disabled** – The central heating circulators will only be enabled during a central heating call.

Default: Disabled

**CH Post Pump Time** sets how long the central heating circulators will continue to operate at the completion of a heating call. Any call during the CH Post Pump Time will be ignored until the post pump has completed. The CH Post Pump Time feature allows the heat remaining in the appliance at the completion of a call to be sent to the heating system, which will improve the overall efficiency of the system.

Adjust the CH Post Pump Time value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 5 min
CHAPTER 2 - CH SETTINGS

The Freeze Protection menu allows the feature to be enabled and disabled. The built-in frost protection mechanism activates the system pumps as soon as the flow temperature [NTC1 probe] drops below 46°F. As soon as the flow temperature is at 42°F, the burner starts up until the flow temperature rises above 60°F. The pumps continue to run for around 10 minutes.

Select Enabled or Disabled using the UP or DOWN keys, then store the setting with the OK key.

- **Enabled** – The Freeze Protection feature protects the installation from freezing at a predetermined system flow temperature.
- **Disabled** – The Freeze Protection feature is disabled. Only the pumps operate.

Default: Enabled

**WARNING**

The appliance should NEVER be installed in a location where freezing could occur. Subjecting the appliance to freezing conditions could lead to freezing of the condensate possibly causing serious injury or death.

**CAUTION**

Freeze Protection should only be disabled when the system contains antifreeze to prevent the system from freezing. Serious damage could occur to the appliance as well as the entire heating system if Freeze Protection is disabled without antifreeze in the system.

**Frost Protection Setpoint** allows to define the outside air temperature at which the anti-freeze function is activated (only available if an outdoor temperature sensor is connected). The pumps are activated when the outside temperature drops below the threshold defined in this menu.

Adjust the Frost Protection Setpoint using the LEFT or RIGHT keys, then store the setting with the OK key.

**CAUTION**

In order to enable the protection of the whole system against freezing, all the valves of the radiators and the convectors should be completely open.

Default: -22°F
**Parallel Shift** allows the CH setpoint to be externally adjusted when a Constant option is chosen in Demand Type. When a Constant option is chosen in Demand Type, continuous CH1 and CH2 heating calls are generated. Simultaneous CH1 and CH2 calls will result in the Appliance operating at the highest CH1 or CH2 setpoint. The CH1 or CH2 Thermostat terminals with the highest setpoint will be used to adjust the setpoint. If the Thermostat terminals with the highest setpoint are open, the CH setpoint will decrease by the Parallel Shift Value. If the Thermostat terminals with the highest setpoint are closed, the CH setpoint will return to the highest CH1 or CH2 setpoint. Adjust the Parallel Shift Value using the LEFT or RIGHT keys, then store the setting with the OK key.

**Default:** 0°F

**CH Call Blocking** sets the minimum time between burner firings for central heating calls. At the completion of a burner firing, the CH Call Blocking time will begin. The burner will not fire again until after the CH Call Blocking time has elapsed. The CH Call Blocking time only prevents the burner from firing, the central heating circulators will respond to a central heating call. This blocking time has no affect on domestic hot water calls. The CH Call Blocking feature prevents short cycling of the burner and extends the life of the burner components. Adjust the CH Call Blocking value using the LEFT or RIGHT keys, then store the setting with the OK key.

**Default:** 2 min.

**Appliance min CH Setpoint** - The minimum setpoint can be reduced when the heating system is needing it to defrost installations. Adjust the Appliance min. CH Setpoint using the LEFT or RIGHT keys, then store the setting with the OK key.

**Default:** 60°F.
CHAPTER 3 - DHW SETTINGS (PRESTIGE, HEATMASTER AND INSTINCT SOLO)

DHW Operation allows the domestic hot water function to be enabled and disabled. Select Enabled or Disabled using the UP or DOWN keys, then store the setting with the OK key.

- **Enabled** - The appliance will respond to a domestic hot water call.
- **Disabled** - The appliance will not respond to a domestic hot water call. The domestic hot water operation disabled icon (囍) is displayed on the home screen when domestic hot water operation has been disabled.

DHW Operation default: Enabled

DHW Setting menu contains settings related to domestic hot water operation. Each line contains a DHW Setting followed by its current value. Six DHW Settings are displayed on the screen at one time.

**NOTICE**

Navigate on the screen using the UP, DOWN, LEFT and RIGHT keys, then validate a selection with the OK key. To increase/decrease values, use the UP and DOWN or LEFT and RIGHT keys, according to the situation and validate with OK.

DHW Setting:

- **DHW Operation** Enabled
- **Demand Type** Thermostat
- **DHW maximum capacity** 100%
- **DHW Setpoint** 140°F
- **DHW on Differential** 6°F

**Demand Type** allows the installer to select the type of device which will generate a domestic hot water call. Select the DHW Demand Type using the UP or DOWN keys, then store the setting with the OK key.

The DHW Demand options are:

- **Thermostat** - A domestic hot water call from an aquastat or dry contact switch will enable the Appliance with a fixed setpoint for a domestic hot water call.
- **Sensor** - This option requires the use of an Indirect Water Heater Sensor. The Appliance will monitor the DHW storage temperature and generate a domestic hot water call when the temperature drops below the DHW Storage Setpoint - DHW On Differential.

Default: Thermostat (PRESTIGE Solo / INSTINCT Solo)
Default: Sensor (PRESTIGE Excellence / HEATMASTER TC)
CHAPTER 3 - DHW SETTINGS (PRESTIGE, HEATMASTER AND INSTINCT SOLO)

**DHW Maximum Capacity** limits the maximum DHW capacity. The appliance capacity can be defined by adjusting this value, 100% means Maximum DHW output, 0% means minimum DHW output. It is therefore possible to adjust the DHW capacity to the installation needs.

Example: when set to 60%, the real appliance capacity is the appliance minimum capacity plus 60% of the difference between the maximum and minimum capacity.

Adjust the DHW Maximum Capacity value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 100%

**DHW Boiler Setpoint** is the fixed appliance setpoint temperature during a domestic hot water call when the Thermostat option is chosen in Demand Type.

Adjust the DHW Boiler Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 168°F

**DHW Setpoint** is the domestic hot water storage setpoint temperature when the Sensor option is chosen in Demand Type.

Adjust the DHW Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 140°F

*NOTICE*

The appliance setpoint is automatically set to the **DHW Setpoint + DHW Storage adder** when the Sensor option is chosen.

**DHW On Differential** sets how far the DHW storage temperature must fall below the DHW Storage Setpoint to create a domestic hot water call when the Sensor option is chosen in Demand Type. The domestic hot water call will end when the DHW storage temperature rises above the DHW Storage Setpoint.

Adjust the DHW On Differential value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 6°F

**WARNING**

The DHW on differential setting greatly affects the production of domestic hot water. A low setting could result in a rapid response to a domestic hot water call resulting in a potential scald hazard. It is strongly recommended that the installer use a thermostatic mixing valve on the hot water outlet of the Indirect Water Heater. Failure to comply can result in substantial property damage, serious injury, or death.
CHAPTER 3 - DHW SETTINGS (PRESTIGE, HEATMASTER AND INSTINCT SOLO)

**DHW Setting**

- **DHW maximum capacity**: 100%
- **DHW Boiler Setpoint**: 168°F
- **DHW Setpoint**: 140°F
- **DHW on Differential**: 6°F
- **DHW Storage Adder**: 28°F
- **DHW Post Pump Time**: 2 min
- **DHW Priority Timeout**: Off

**DHW Storage Adder** is used to compute the appliance setpoint when the Sensor option is chosen in Demand Type. The appliance setpoint will be DHW Storage Setpoint + DHW Storage Adder for a domestic hot water call.

Adjust the DHW Storage Adder value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 28°F

**DHW Post Pump Time** sets how long the domestic hot water circulator will continue to operate at the completion of a domestic hot water call. Any call during the DHW Post Pump Time will be ignored until the post pump has completed. The DHW Post Pump feature allows the heat remaining in the appliance at the completion of a call to be sent to the Indirect Water Heater, which will improve the overall efficiency of the system.

Adjust the DHW Post Pump value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 2 min.

**DHW Priority Timeout** allows the installer to enter an optional time limit that a domestic hot water call has priority over a central heating call when DHW Priority is set to Enabled.

Adjust the DHW Priority Timeout value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: Off

**DHW Priority** allows the domestic hot water priority function to be enabled and disabled.

Select Enabled or Disabled using the UP or DOWN keys, then store the setting with the OK key.

- **Enabled** - Domestic hot water calls will have priority over a central heating call. The appliance setpoint will be set to the domestic hot water setpoint during a domestic hot water call. The DHW circulator will be enabled and the heating circulators will be disabled during a domestic hot water call.
- **Disabled** - Domestic hot water calls will not have priority over a central heating call. The appliance setpoint will be set to the domestic hot water setpoint when only a domestic hot water call is present. The appliance setpoint will be set to the highest setpoint when simultaneous domestic hot water and central heating calls are present. The DHW circulator will be enabled during a domestic hot water call. The heating circulators will be enabled during a central heating call.

Default: Enabled

**NOTICE**

Simultaneous domestic hot water and central heating calls will result in the appliance operating at the highest target temperature when DHW Priority is set to disabled. The use of a mixing device on the lower temperature zones may be required to protect the lower temperature zones from damage.
CHAPTER 3 - DHW SETTINGS (PRESTIGE, HEATMASTER AND INSTINCT SOLO)

**DHW To CH Call Blocking** sets the minimum time between a DHW burner firing and a CH burner firing. At the completion of a DHW burner firing, the DHW to CH Call Blocking time will begin. The burner will not fire again until after the DHW Call Blocking time has elapsed. The DHW Call Blocking time only prevents the burner from firing, the domestic hot water circulator will respond to a domestic hot water call. This blocking time has no affect on central heating calls. The DHW Call Blocking feature prevents short cycling of the burner and extends the life of the burner components.

Adjust the DHW Call Blocking value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 0 min.

**DHW Call Blocking** sets the minimum time between burner firings for domestic hot water calls. At the completion of a burner firing, the DHW Call Blocking time will begin. The burner will not fire again until after the DHW Call Blocking time has elapsed. The DHW Call Blocking time only prevents the burner from firing, the domestic hot water circulator will respond to a domestic hot water call. This blocking time has no affect on central heating calls. The DHW Call Blocking feature prevents short cycling of the burner and extends the life of the burner components.

Adjust the DHW Call Blocking value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 0 min.

**DHW Call Blocking** sets the minimum time between burner firings for domestic hot water calls. At the completion of a burner firing, the DHW Call Blocking time will begin. The burner will not fire again until after the DHW Call Blocking time has elapsed. The DHW Call Blocking time only prevents the burner from firing, the domestic hot water circulator will respond to a domestic hot water call. This blocking time has no affect on central heating calls. The DHW Call Blocking feature prevents short cycling of the burner and extends the life of the burner components.

Adjust the DHW Call Blocking value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 0 min.
CHAPTER 3 - DHW SETTINGS (PRESTIGE, HEATMASTER AND INSTINCT SOLO)

The **Antilegionella Function** ensures that an Indirect Water Heater is heated at least once per week to prevent the growth of Legionella bacteria.

Select **Enabled** or **Disabled** using the **UP** or **DOWN** keys, then store the setting with the **OK** key.

- **Enabled** - When the **Thermostat** option is chosen in Demand Type, a domestic hot water call is generated for 15 minutes once per week to heat the Indirect Water Heater.

  When the **Sensor** option is chosen in Demand Type, a domestic hot water call is generated until the DHW storage temperature reaches 140°C once per week. When the Sensor option is chosen in Demand Type, the weekly timer is reset whenever the DHW storage temperature reaches 140°C to prevent unnecessary firings. This function will be active even if DHW Operation has been set to Disabled.

- **Disabled** - The Appliance will only fire in DHW mode when a domestic hot water call is received.

**Default:** Disabled

The antilegionella function should only be enabled when an Indirect Water Heater is installed. Enabling the antilegionella function without an Indirect Water Heater will result in the Appliance firing once per week in DHW mode. This could cause a Manual Reset Hard Lockout of the appliance.

**WARNING**

NOTE

**The antilegionella function is most effective when the Sensor option is chosen in DHW demand. The use of an Indirect Water Heater Sensor ensures that the domestic hot water is heated to 140°F at least once a week.**

The **DHW Ramp up** function limits the CH temperature rise of the CH water during the startup of the appliance in DHW mode. The parameter is expressed in °C/min.

Adjust the **DHW Ramp Up** value using the **LEFT** or **RIGHT** keys, then store the setting with the **OK** key.

**Default:** Off
**CHAPTER 4 - DHW SETTINGS (INSTINCT COMBI ONLY)**

### Installer Code

**CH & DHW Settings**

**DHW Setting**

- **DHW Operation**
  - **Enabled**
  - **Disabled**

**DHW Operation default: Enabled**

**DHW Setpoint**

- **DHW Setpoint** is the fixed setpoint temperature during a domestic hot water call.

**DHW Post Pump Time**

**NOTICE**

Navigate on the screen using the UP, DOWN, LEFT and RIGHT keys, then validate a selection with the OK key. To increase/decrease values, use the UP and DOWN or LEFT and RIGHT keys, according to the situation and validate with OK.

The DHW Setting menu contains settings related to domestic hot water operation. Each line contains a DHW Setting followed by its current value. Six DHW Settings are displayed on the screen at one time.

**DHW Operation** prompts to enter the fixed setpoint temperature during a domestic hot water call.

Select **Enabled** or **Disabled** using the UP or DOWN keys, then store the setting with the OK key.

- **Enabled** - The appliance will respond to a domestic hot water call.
- **Disabled** - The appliance will not respond to a domestic hot water call. The domestic hot water operation disabled icon (.Socket) is displayed on the home screen when domestic hot water operation has been disabled.

**DHW Operation default: Enabled**

**DHW Setpoint**

Adjust the DHW Setpoint value using the LEFT or RIGHT keys, then store the setting with the OK key.

**Default: 140°F**
CHAPTER 4 - DHW SETTINGS (INSTINCT COMBI ONLY)

DHW Setting

DHW Setting

DHW On Differential

DHW Operation Enabled
DHW Setpoint 140°F
DHW On Differential 18°F
Warmstart Temperature 126°F
Warmstart Hysteresis 30°F
DHW Post Pump Time 2 min

DHW Operation Enabled
DHW Setpoint 140°F
DHW on Differential 18°F
Warm start Temperature 126°F
Warm start Hysteresis 30°F
DHW Post Pump Time 2 min

DHW On Differential

DHW On Differential sets how far the DHW temperature of the storage tank must fall below the DHW Setpoint to create a domestic hot water call. This is defined by the sensor of the external DHW storage tank connected to the appliance. The domestic hot water call will end when the DHW storage tank temperature rises above the DHW setpoint.

Adjust the DHW On Differential value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 18°F

WARNING

The DHW on differential setting greatly affects the production of domestic hot water. A low setting could result in a rapid response to a domestic hot water call resulting in a potential scald hazard. It is strongly recommended that the installer use a thermostatic mixing valve on the hot water outlet of the storage tank. Failure to comply can result in substantial property damage, serious injury, or death.

Warmstart Temperature sets the desired temperature to keep the hydroblock at, in order to speed up hot water delivery time.

Adjust the Warmstart Temperature using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 125°F [52°C].

DHW Warmstart Hysteresis

DHW Warmstart Hysteresis sets how low the internal Domestic Hot Water temperature must fall (between 9°F (5K) and 36°F (20K)) the Warmstart Temperature to activate the Warmstart function.

Adjust the DHW Warmstart Hysteresis value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 30°F [17°C].

DHW Post Pump Time

DHW Post Pump Time sets how long the domestic hot water circulator will continue to operate at the completion of a domestic hot water call. Any call during the DHW Post Pump Time will be ignored until the post pump has completed. The DHW Post Pump feature allows the heat remaining in the appliance at the completion of a call to be sent to the Indirect Water Heater, which will improve the overall efficiency of the system.

Adjust the DHW Post Pump Time value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 2 min.
**CHAPTER 4 - DHW SETTINGS (INSTINCT COMBI ONLY)**

**DHW Setting**
- DHW Setpoint: 140°F
- DHW on Differential: 18°F
- Warmstart Temperature: 126°F
- Warmstart Hysteresis: 30°F
- DHW Post Pump Time: 2 min

**DHW Priority Timeout** allows the installer to enter an optional time limit that a domestic hot water call has priority over a central heating call when DHW Priority is set to Enabled.
Adjust the DHW Priority Timeout value using the LEFT or RIGHT keys, then store the setting with the OK key.
Default: Off

**DHW Call Blocking** sets the minimum time between burner firings for domestic hot water calls. At the completion of a burner firing, the DHW Call Blocking time will begin. The burner will not fire again until after the DHW Call Blocking time has elapsed. The DHW Call Blocking time only prevents the burner from firing, the domestic hot water circulator will respond to a domestic hot water call. This blocking time has no affect on central heating calls. The DHW Call Blocking feature prevents short cycling of the burner and extends the life of the burner components.
Adjust the DHW Call Blocking value using the LEFT or RIGHT keys, then store the setting with the OK key.
Default: 0 min

**DHW To CH Call Blocking** sets the minimum time between a DHW burner firing and a CH burner firing. At the completion of a DHW burner firing, the DHW to CH Call Blocking time will begin. The burner will not fire again for a central heating call until after the DHW To CH Call Blocking time has elapsed. This feature only prevents the burner from firing, the central heating circulators will respond to a central heating call. This blocking time has no effect on domestic hot water calls. The DHW To CH Call Blocking feature prevents the burner from firing when switching from a domestic hot water call to a central heating call. This allows the remaining heat in the heat exchanger to be dissipated and potentially satisfy the central heating call.
Adjust the DHW to CH Call Blocking value using the LEFT or RIGHT keys, then store the setting with the OK key.
Default: 1 min.
CHAPTER 5 - BOILER SETTINGS

**NOTICE**

Navigate on the screen using the UP, DOWN, LEFT and RIGHT keys, then the validate a selection with the OK key. To increase/decrease values, use the UP and DOWN or LEFT and RIGHT keys, according to the situation and validate with OK.

The **Boiler Settings** menu contains settings related to appliance operation. Each line contains an appliance setting followed by its current value.

The **Model** menu indicates the model and possibly type of appliance for which the system is set up. Five different models can be displayed: PRESTIGE Solo, PRESTIGE 3WV (for Prestige Excellence), HEATMASTER, INSTINCT Solo AND INSTINCT Combi.

The **Lockout Temp.** setting allows testing of the overheat thermostat function at a reduced temperature. It temporarily decreases the overheat temperature of the appliance to **102°F** which allows a safe demonstration of the function. When setting the value to **102°F**, a High temperature lock-out (E3) will occur when the boiler reaches **102°F**. Scroll through the settings using the UP or DOWN keys, then validate the selection with the OK key.

**Default: 210°F**

This parameter sets the **Modbus address** of the appliance in a Modbus based communication system. Adjust the Modbus Address value using the LEFT or RIGHT keys, then store the setting with the OK key.

**Default: 0=BCST**
CHAPTER 5 - BOILER SETTINGS

Boiler Settings

Model: Prestige Solo
Lockout Temp.: 210°F [99°C]
Modbus Address: 0x8047

Pump settings

Mix zone high limit: 45°C

Pump Settings

Current Pump Config
Preset Pump Config
Flexible Pump Config
Pump PWM minimum: 40%

Preset Pump Config

Config 1
Config 2
Config 3
Config 4
Config 5
Config 6

Flexible Pump Config

Low Pump (L)
Low Pump (R)
Low Pump (F)
Low Pump (D)
Low Pump (S)
Low Pump (H)

The Pump Settings menu allows to choose the right pump configuration to the chosen hydraulic configuration.

The Current Pump Config indicates which configuration is currently selected for the appliance.

Two appliance configuration modes are available: a preset configuration mode and a flexible configuration mode.

Scroll through the settings using the UP or DOWN keys, then validate the selection with the OK key.

In the Preset Pump Config, (preferred selection) you can choose from a number of preset pump configurations. Only the configurations usable with a certain model/type of appliance will appear in the list. Each configuration is detailed through one or several hydraulic diagrams, a table indicating the electrical connections and a list of the parameters to be defined in CTRLMax.

Scroll through the settings using the UP or DOWN keys, then validate the selection with the OK key.

NOTICE

Although the menu is available in the INSTINCT units, do not use the Preset Pump Config Function, unless specified in Fig. 3 on page 29 thru Fig. 16 on page 42.

The Flexible Pump Config, menu allows to customize the pump configuration to the chosen hydraulic configuration. Only select this option when the preset configurations do not offer you a solution. In this menu you have to choose per relay for which heat demand/function it will be activated. The relays are allocated as follows by default (see picture below for physical location on the optional terminal blocks):

- Flex. Relay 1 ------- CH
- Flex. Relay 2 ------- DHW
- Flex. Relay 3 ------- P3
- Flex. Relay 4 ------- ERR
- Flex. Relay 5 ------- FL
- Flex. Relay 6 ------- P4

Scroll through the settings using the UP or DOWN keys, then validate the selection with the OK key.

NOTICE

- The use of the Flexible Pump Config menu is not possible for the Solo/Excellence (3 way valve).
- Flex Relays 3, 4 and 6 are not available in INSTINCT units.
Each relay function has several options. Activation will happen when one of the following options has been chosen: CH1, CH2, DHW, MIX OPEN, MIX CLOSE, ERROR, FLAME.

More than one action can be chosen for one relay (one relay can become active for CH1, CH2 and DHW demand when needed).

Scroll through the settings using the UP or DOWN keys, then with the OK key, toggle between the On/Off status of each relay. Then go to the next line, until you reach the last line.

- When selecting CH1, the relay is activated at CH1 demand.
- When selecting CH2, the relay is activated at CH2 demand.
- When selecting DHW, the relay is activated at DHW demand.
- When selecting Mix Open, the Mixing valve open input is activated. Provided there is a mixing valve in the hydraulic circuit, runtime is assumed to be 120 sec.
- When selecting Mix Close, the Mixing valve close input is activated. Provided there is a mixing valve in the hydraulic circuit, runtime is assumed to be 120 sec.
- When selecting ERROR, the relay is activated on error.
- When selecting FLAME, the relay is activated when appliance is running and a flame signal has been detected.

**NOTICE**

Using the RIGHT key then the OK key takes you back to the previous screen, but THE CHANGED VALUES ARE NOT STORED in the memory (Quick escape route).

To save your changes, make sure to scroll down to the last line of the screen until Save & Exit is highlighted. Then activate the function with the OK key.

Activate Save & Exit with the OK key. This will ensure that changed data are stored in the appliance.
CHAPTER 5 - BOILER SETTINGS

Boiler Settings

Model: Prestige Solo
Lockout Temp: 210°F [99°C]
Modbus Address: 0=BCST

Pump settings

Ignition Level: 3500rpm
Mix zone high limit: 45°C

Error Relay

There are three possible selections to activate the Error Relay (alarm) contact:

- **On Lockout, Blocking and Warning**: the error relay is activated at a non-volatile lock-out (e.g. CH Flow NTC defect), at a blocking error (self-resetting errors) (e.g. Gas-pressure switch not closed), or at a warning (e.g. low water pressure warning).
- **On Lock-out and blocking**: the error relay is activated at a non-volatile lock-out or a blocking error.
- **On Lockout**: the error relay is activated at a non-volatile lock-out only.

The selection depends on the alarm feedback requirement from the customer. Scroll through the settings using the UP or DOWN keys, then validate the selection with the OK key.

NOTICE

Although the function and the screen are displayed, this function is not in use. Any change made to the value will not affect the operation of the appliance.

The Ignition Level parameter allows to change the fan start speed of the appliance. The default value depends on the model and varies according to the table below.

Adjust the Ignition Level value using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: See table below for each fan speed applicable to each appliance/gas combination.

<table>

</tbody>
</table>
CHAPTER 5 - BOILER SETTINGS

The **Mix zone high limit** setting allows to limit the maximum temperature in the mixed circuit. The function works like an Overheat Cut-off Activation of the limit and will cause the appliance to go in fault state (lockout). This setting allows to change the limit temperature for the mixed circuit.

**NOTICE**

*Be aware that for Floor Heating systems this temperature may NOT be adjusted. A higher temperature setting may damage your floor heating circuit.*

Adjust the Mix Zone High Limits value using the **LEFT** or **RIGHT** keys, then store the setting with the **OK** key.

Default: **114°F**

The **WP diff trigger** parameter is the required pressure change when the internal pump of a HeatMaster is starting. This function allows to detect the correct operation of the appliance internal pump.

Adjust the Modbus Address value using the **LEFT** or **RIGHT** keys, then store the setting with the **OK** key.

HeatMaster TC Default: **290cpsi**

Prestige/Instinct Default: **0cpsi** (function not used in Prestige and Instinct boilers)

The **Appliance Setting** allows to change the appliance type and model using a specific code. The appliance type and model are factory preset for the appliance you have received. This means that parameters are already set for the appliance, and the appliance type **MAY NOT** be changed, unless the CTRLMax mainboard is replaced or repaired, or a gas conversion is made to the appliance.

If the appliance type needs to be entered, please refer to the appliance code written on the data plate located at the side of the boiler.

Increase/decrease the value (from 0 to 9, then A to Z) using the **UP** or **DOWN** keys to, then change position with the **LEFT** or **RIGHT** keys.

Once the code has been entered, confirm the code by pressing **OK**, then follow the instructions displayed on the screen: press the installer button (PRESTIGE/HEATMASTER), or touch the **UP** key (INSTINCT).

Actuate the **UP**, **DOWN**, **LEFT** or **RIGHT** keys to go back to the previous screen and change the code if you made a mistake when entering the code.

The software will then process the change and return to the Main screen.
The **Altitude** parameter allows to define the altitude at which your system is installed and compensate for the possible change in air density when in higher altitude. The altitude parameter can be adjusted in steps of 984 ft.

Adjust the Altitude value using the **LEFT** or **RIGHT** keys then validate your selection with the **OK** key.

**Default**: 0 ft.

INTENTIONALLY LEFT BLANK
CHAPTER 6 - MANUAL OPERATION

To ensure the operation of the heating system, make sure to switch on one of the pumps.

**FAN** - Actuate the **OK** key while the FAN icon is highlighted to manually fire the burner and power the CH (1) circulator. Adjust the firing rate from 0% (Low Fire) to 100% (High Fire) using the **LEFT** and **RIGHT** keys. Hold down the **LEFT** or **RIGHT** keys to rapidly increase or decrease the firing rate. Actuate the **OK** key again while the FAN icon is highlighted to shutdown the burner when finished.

**CH1** - Actuate the **OK** key while the CH1 icon is highlighted to manually power the CH 1 circulator(s) as in CH demand. Actuate the **OK** key again while the CH1 icon is highlighted to shutdown the CH1 circulator(s).

![Notice]

The auxiliary Appliance circulator is also powered when the CH1 circulator is manually enabled.

**DHW** - Actuate the **OK** key while the DHW icon is highlighted to manually power the DHW circulator(s) as in DHW demand. Actuate the **OK** key again while the DHW icon is highlighted to shutdown the DHW circulator(s).

![Notice]

The auxiliary Appliance circulator is also powered when the DHW circulator is manually enabled.

**CH2** - Actuate the **OK** key while the CH2 icon is highlighted to manually power the CH2 circulator(s) as in CH demand. Actuate the **OK** key again while the CH2 icon is highlighted to shutdown the CH2 circulator(s).

CHAPTER 8 - CASCADE

8.1. Operating Principles of an CTRL-Max-Controlled Cascade (PRESTIGE and INSTINCT only)

PRESTIGE and INSTINCT boilers can be setup in a cascade configuration (max. 6 boilers) that is controlled by the CTRLMax Boiler Control System.

The boilers can operate together without the need for an external cascade controller. One unit will be selected as the Master and will be wired to accept all the low voltage control signals and all the system pumps. The Master appliance organizes the distribution of the heat demands over the appliances in the cascade.

The other boilers will be designated as Slaves and will only respond to calls from the Master Boiler and will not respond to internal sensors. The internal supply sensor will still limit the local.

The CH heat demands follow the same logic as the heat demands in a single appliance: the target setpoint at first start-up is calculated, following a temperature rise of 7.2°F/min. The start-up sequence calculates the desired capacity according to the target setpoint.

The first appliance starts and as soon as it reaches twice the minimum capacity of the appliance, the second appliance will be started when the stage delay has expired. Both appliances are then running at minimum capacity.

The capacity increase continues following the rise of the calculated target setpoint. The third appliance will be started as soon as the two appliances have reached 3 times the minimum capacity. The cascading strategy is to have more boilers running at lower speeds than less boilers running at higher speeds.

The control parameters to determine the control speed of the cascade is derived from the individual appliance capacity parameter.

As soon as the System temperature comes in reach of the target system temperature the capacity increase will stop and the normal temperature control takes over.

**NOTICE**

Be aware that in a cascade the temperature control is done on the system temperature and **NOT on the local temperature.** That means that the local temperature can be easily 9 to 12°F higher than the system temperature depending on the position of the system sensor.

The Cascade control works as a power control on the local appliances. The system temperature is the parameter to regulate and the local temperatures are of no avail, they are only used to limit the local power in case the max. temperature is reached.

**Additional characteristics:**

1. The Cascade function allows up to six identical boilers to operate together in a single heating system.
2. Parallel Modulation fires as many boilers as possible to maximize system efficiency.
3. The Auto rotation function rotates the lead boiler every time a call for heat is received when a Thermostat option is chosen in CH Demand or every 24 hours when a Constant option is chosen in CH Demand.

8.2. Cascade Algorithm

8.2.1. Boiler Enabling Algorithm

The Master boiler uses the following algorithm to determine when the next boiler can be enabled:

\[
\text{Number of Boilers Firing} + 1 \times \text{Min. Firing Rate} = \text{Individual Boiler Firing Rate}
\]

Once the currently fired boilers reach the calculated firing rate, the next boiler can be enabled without affecting the overall cascade firing rate.

For example, the calculation for a Cascade System consisting of two PRESTIGE Solo 399s would be:

\[
\frac{1+1}{1} \times 25\% = 50\%
\]

Once the first PRESTIGE Solo 399 firing rate reaches 50%, the second PRESTIGE Solo 399 can be enabled. Both will then fire at the minimum 25% firing rate so that the overall output from the Cascade System remains the same.

8.2.2. Boiler Disabling Algorithm

Once the firing rate of all currently fired boilers decreases to the Minimum Firing Rate, a boiler can be disabled. The boilers which continue to fire will increase their firing rate if required to replace the output of the disabled boiler.

Stable cascade operation requires that all boilers in a Cascade System be the same size. Mixing boiler sizes in a Cascade System could lead to temperature fluctuations and erratic cascade operation.
CHAPTER 8 - CASCADE

8.3. CTRLMax Cascade menu structure

8.4. Cascade Installation

8.4.1 System Piping

Standard Cascade installations will utilize a balanced manifold system as the primary / secondary connection to the system piping as shown in Fig. 27 on page 67 or a reverse return piping arrangement as shown in Fig. 29 on page 69.

Split Cascade installations will utilize a balanced manifold system as the primary / secondary connection to the central heating loop. Each boiler configured to respond to a domestic hot water call will also have a direct connection to the indirect water heater as shown in Fig. 31 on page 71. Reference the boiler Installation and Maintenance Manual for general boiler installation and piping requirements.

8.4.2 System Sensor Installation

Cascade operation requires a System Temperature Sensor to be installed on the common supply header downstream of all boilers in the system. Place the System Temperature Sensor within 10’ of the last boiler in the Cascade System for an accurate temperature reading. Proper placement and installation of the System Temperature Sensor is critical for reliable cascade operation. The type of System Temperature Sensor chosen also greatly affects the accuracy of the system temperature readings.

Three types of System Temperature Sensor are available:

- **Direct Immersion** - A direct immersion temperature sensor (MDRKIT05) is the recommended type since it will provide the most accurate water temperature readings. Install the 1/2”NPT direct immersion temperature sensor in a tee on the common supply header downstream of all boilers in the system. Ensure that the temperature sensor probe is directly in the water flow but not touching the opposite side of the tee. Wire the sensor to terminals 3 & 4 of X5 on the control module of the Master boiler.

- **Dry Well Installation** – A temperature sensor (PSRKIT22) installed in a dry well will measure up to 10°F [5°C] lower than the actual water temperature. All water setpoints must be lowered at the Master boiler by 10°F [5°C] from the desired setpoints for reliable Cascade operation. Install a 3/8”ID drywell in the common supply header downstream of all boilers in the system. The drywell should be long enough to be directly in the water flow for the most accurate temperature reading. Insert the temperature sensor into the well and wire to terminals 3 & 4 of X5 on the control module of the Master boiler.

- **Pipe Mounted Installation** – A temperature sensor (PTSENS12) mounted to the outside of the pipe will measure up to 20°F [11°C] lower than the actual water temperature. All water setpoints must be lowered at the Master boiler by 20°F [11°C] from the desired setpoints for reliable Cascade operation. The Pipe Mounted temperature sensor can be directly strapped to the outside of a 1” to 3” metallic pipe.
CHAPTER 8 - CASCADE

Fig. 24 - System Sensor Direct Immersion

Install the temperature sensor as follows:

1. Remove the white plastic cover from the sensor
2. Cut a small slit in the gasket seal on the end of the sensor.
3. Route 18 AWG 2-wire cable or similar cable through the seal gasket into the enclosure.
4. Push down on the orange wire terminal retainers to insert the wires into the sensor terminals. Release the orange wire terminal retainers and confirm that the wires are firmly attached to the sensor terminals.
5. Select a location for the sensor on the common supply header downstream of all boilers in the system. Clean the pipe with fine sandpaper or emery cloth to ensure the pipe is clean and sensor will make good contact with the pipe.
6. Actuate the white cover onto the sensor and strap the sensor to the pipe using the included wire tie.
7. Wire the sensor to terminals 3 & 4 of X5 on the control module of the Master boiler.

8.4.3 Cascade Communication Cable

A communication cable PACAB01 must be installed between each boiler in the Cascade System. The cable has a 4 pin molex connector on one end and a 6 pin molex connector on the other end. The 4 pin molex connector plugs into the Cascade Master X16 connector on the control module of the Master boiler or prior Slave boiler in cascades of three or more boilers. The 6 pin molex connector plugs into the Cascade Slave connector of the Slave boiler. Reference Fig. 28 on page 68, Fig. 30 on page 70 and Fig. 32 on page 72 for wiring details.

8.4.4 Low Voltage Wiring Connections

- **Thermostat Wiring** – CH1 and CH2 calls must be wired into the Cascade Master.
- **Outdoor Sensor Wiring** – The outdoor temperature sensor must be wired into the Cascade Master.
- **Domestic Hot Water Wiring** – A DHW call must be wired into the Cascade Master.
- **Additional Boiler Limits** – Boiler Limits must be wired into each boiler in the Cascade System. When a boiler limit opens, that particular boiler will lockout and will be removed from Cascade System operation. The other boilers in the Cascade System will continue to operate if they are not in a lockout.
- **External Modulation Control** – An External Modulation Signal must be wired into the Cascade Master. The modulation signal will control the firing rate of the entire Cascade System, not just the Cascade Master.
- **Modbus Wiring** – A building management system (BMS) connection must be wired into the Cascade Master to obtain cascade system and Master boiler information.
CHAPTER 8 - CASCADE

8.4.5 Line Voltage Wiring Connections

- **Circulator Wiring** - Reference Figures 22, 24 and 26 on pages 58, 60 and 62 for circulator wiring required for each type of Cascade System. The circulator connections used will depend on the systems piping layout. All circulators are powered from a common 5A fuse located on the control module. The total combined amp draw of the circulators must not exceed 5 amps at any time. Use an isolation relay to lower the total combined amp draw if exceeding this limits.

- **Power Supply** – A dedicated 120 VAC / 15A minimum service must be used to power the boilers in the Cascade System. Multiple boilers in the Cascade System can be placed on the same electrical circuit. Each boiler can draw a maximum of 8 amps.

- **Alarm Wiring** – The alarm contact closes whenever that particular boiler is in a condition set by the Error Relay Setting. The alarm contact will also close on the Master boiler when any of the Slave boilers are locked in a condition set by the Error Relay setting.

8.4.6 Cascade Autodetection

The Cascade System must be configured after wiring is completed and any required adjustments are made in Cascade Settings. The Cascade Autodetection function automatically finds and configures all boilers in the Cascade System. This eliminates the need to manually configure each boiler of the Cascade System. Select Cascade Autodetection on the Master boiler then follow the on-screen instructions to perform Cascade Autodetection. Once Cascade Autodetection is finished, a message will be displayed indicating how many boilers have been found. If the number of boilers found is correct, press OK to finish Cascade Autodetection. If the number of boilers found is not correct, check the cascade communication cables between the boilers and repeat Cascade Autodetection. See navigation on next page.

8.4.7 Lockouts

If a lockout occurs to a boiler in a Cascade System, it will be removed from Cascade System operation. The remainder of the Cascade System continues to operate and the next available boiler will fire if necessary. The Lockout Screen will be displayed on the locked out boiler as well as the Master boiler. The Master boiler Lockout Screen will also indicate which boiler in the Cascade System is locked out. See Fig. 20 below.

**Fig. 26 - Lockouts in a cascade**
CHAPTER 8 - CASCADE

The Cascade System must be configured after wiring is completed and any required adjustments are made in Cascade Settings.

The Cascade Autodetection function automatically finds and configures all boilers in the Cascade System. This eliminates the need to manually configure each boiler of the Cascade System. Select Cascade Autodetection on the Master boiler then follow the on-screen instructions to perform Cascade Autodetection.

Once Cascade Autodetection is finished, a message will be displayed indicating how many boilers have been found. If the number of boilers found is correct, press OK to finish Cascade Autodetection.

If the number of boilers found is not correct, check the cascade communication cables between the boilers and repeat Cascade Autodetection process.

NOTICE

Navigate on the screen using the UP, DOWN, LEFT and RIGHT keys, then the validate a selection with the OK key. To increase/decrease values, use the UP and DOWN or LEFT and RIGHT keys, according to the situation and validate with OK.
**CHAPTER 8 - CASCADE**

Cascade Info provides real time operating information of the Cascade System. Each line contains an information item followed by its current value.

Cascade Info provides the following information item:

- **Cascade Role** - Displays the current role of the appliance in the Cascade System. Cascade Role will be one of the following:
  - **Master** – Indicates this appliance is the Master boiler in the Cascade System.
  - **Slave** – Indicates this appliance is a Slave boiler in the Cascade System.
  - **Standalone** – Indicates this appliance is not part of a Cascade System.

- **System Temp.** - See description below.
- **Active boilers** - Displays the current number of boilers fired in the Cascade System.
- **Total Boilers** - Displays the total number of boilers in the Cascade System.
- **Cascade Firing Rate** - Displays the current firing rate of the entire Cascade System.

**System Temp.** - Displays the current system temperature reading on the Master boiler. If the system sensor is not wired in to the Master boiler, the Master boiler supply temperature is displayed. It has a logging function which records one sample every 12 minutes to produce a graph of the last 24 hours.

Select **System Temp.** in Cascade Info, then actuate the OK key to view the graph.
The Cascade Settings menu contains settings related to cascade operation. Each line contains a Cascade Setting followed by its current value. Six Cascade Settings are displayed on the screen at one time. Scroll through Cascade Settings using the UP or DOWN keys.

Cascade Setting changes must be made on the cascade Master. Cascade autodetection must be performed after making any changes to a cascade Setting before the change will take effect.

**Stage Delay** sets the time delay before enabling or disabling a boiler in the Cascade System. The Stage Delay begins once the Master boiler determines that a boiler must be enabled to reach the setpoint or when the Master boiler determines a boiler should be disabled because of a decreasing load.

Adjust the Stage Delay duration using the LEFT or RIGHT keys, then store the setting with the OK key.

Adjusting the Stage Delay will have the following effects:

- **Increasing Stage delay**
  - Reaching the setpoint could take longer due to a longer delay between enabling boilers.
  - Overshooting the setpoint could occur due to boilers staying on longer before being disabled.

- **Decreasing Stage delay**
  - Overshooting the setpoint could occur due to boilers being enabled quicker.
  - Boilers will be disabled quicker, possibly increasing boiler cycling and decreasing runtimes.
CHAPTER 8 - CASCADE

**Cascade Setting**
- **Stage Delay**: 60 sec
- **Minimum Firing Rate**: 18%
- **Max. Firing Rate**: 398 MBH
- **CH / DHW Boilers**: 0
- **Auto Rotation**: Enabled
- **CH Prop. Gain**: 7

---

**Minimum Firing Rate** is the minimum firing rate of a single boiler in the Cascade System. The Master boiler uses this setting to determine when boilers can be enabled and disabled. Setting the Minimum Firing Rate below the recommended minimum will result in boilers being enabled too quickly which may cause sharp increases in temperature from the Cascade System. Setting the Minimum Firing Rate above the recommended minimum will delay the enabling of boilers which may lower the system efficiency. For more information on the algorithm behind the cascade operation, refer to Section 8.2 on page 55.

Adjust the Minimum Firing Rate using the LEFT or RIGHT keys, then store the setting with the OK key.

Default: 18%

**NOTICE**

Only make changes after being instructed to do so by Triangle Tube as changing of this value may cause instability in the appliance cascade control.

---

**Maximum Firing Rate** is the maximum capacity of a single boiler in the Cascade System. Adjust the Maximum Firing Rate using the LEFT or RIGHT keys, then store the setting with the OK key.

This value, expressed in MBH, will correspond to the current appliance range.

Default: according to the boilers

---

**Model** | **Min. Firing Rate** | **Max. Firing Rate**
---|---|---
Prestige Solo 80 | 18% | 80 MBH
Prestige Solo/Excellence 110 | 18% | 110 MBH
Instinct Solo/Combi 110 | 18% | 110 MBH
Prestige Solo 155 | 18% | 153 MBH
Prestige Solo 175 | 18% | 170 MBH
Prestige Solo 250 | 18% | 240 MBH
Prestige Solo 299 | 18% | 299 MBH
Prestige Solo 399 | 18% | 399 MBH
Instinct Solo/Combi 155 | 18% | 155 MBH
Instinct Combi 199 | 18% | 199 MBH

---

**NOTICE**

Stable cascade operation requires that all boilers in a Cascade System be the same size. Mixing boiler sizes in a Cascade System could lead to temperature fluctuations and erratic cascade operation.
The CH / DHW Boilers setting specifies how many boilers in a Split Cascade System will respond to a domestic hot water call.

The CH / DHW Boilers always include the Master boiler. The remaining boilers will only respond to central heating calls. This allows the Cascade System to satisfy both central heating and domestic hot water calls at the same time. At the completion of a domestic hot water call, the CH or DHW Boilers will again be available to respond to central heating calls.

Adjust the CH/DHW Boilers number using the LEFT or RIGHT keys, then store the setting with the OK key.
CHAPTER 8 - CASCADE

Through the Auto Rotation function, the number of burning hours is equalized over all appliances.

When the function is Enabled, the appliances will all run an equal amount of time. This helps balancing wear over the appliances.

When the function is Disabled, there is no leveling of burning hours and the first appliances in the sequence will run more than the last one in the sequence.

Select Enabled or Disabled using the UP or DOWN keys, then store the setting with the OK key.

CH Proportional Gain allows the cascade response to be adjusted for a central heating call. CH Proportional Gain has the greatest influence when the system temperature is far away from the setpoint.

Adjust the CH Prop. Gain value using the LEFT or RIGHT keys, then store the setting with the OK key.

- **Increase CH Proportional Gain**
  - The Cascade System will reach setpoint faster, but overshooting the setpoint may occur.
  - To reach the setpoint faster, increase the CH Proportional Gain value by 2. Perform Cascade Autodetection and initiate a central heating call. Observe the cascade response and make further adjustments if necessary.

- **Decrease CH Proportional Gain**
  - The Cascade System will take longer to reach the setpoint, but setpoint overshooting is minimized.
  - If the setpoint is reached too quickly, decrease the CH Proportional Gain value by 2. Perform Cascade Autodetection and initiate a central heating call. Observe the cascade response and make further adjustments if necessary.

Default: 7

**NOTICE**

Please consult Triangle Tube’s technical Support before making any adjustments. Improper adjustment of CH Proportional Gain could lead to temperature fluctuations and erratic cascade operation.
CHAPTER 8 - CASCADE

**CH Integral Gain** allows the cascade response to be adjusted for a central heating call. CH Integral Gain has the greatest influence when the system temperature is close to the setpoint.

Adjust the CH Integral Gain value using the LEFT or RIGHT keys, then store the setting with the OK key.

- **Increase CH Integral Gain**
  - The Cascade System will take longer to reach the setpoint, but setpoint overshooting is minimized.
  - If the setpoint is reached too quickly, increase the CH Integral Gain value by 2. Perform Cascade Autodetection and initiate a central heating call. Observe the cascade response and make further adjustments if necessary.

- **Decrease CH Integral Gain**
  - The Cascade System will reach setpoint faster, but overshooting the setpoint may occur.
  - To reach the setpoint faster, decrease the CH Integral Gain value by 2. Perform Cascade Autodetection and initiate a central heating call. Observe the cascade response and make further adjustments if necessary.

Default: 245

**NOTICE**

Please consult Triangle Tube’s technical Support before making any adjustments. Improper adjustment of CH Integral Gain could lead to temperature fluctuations and erratic cascade operation.
CHAPTER 8 - CASCADE

DHW Proportional Gain allows the cascade response to be adjusted for a domestic hot water call. DHW Proportional Gain has the greatest influence when the system temperature is far away from the setpoint.

Adjust the DHW Prop. Gain value using the LEFT or RIGHT keys, then store the setting with the OK key.

- **Increase DHW Proportional Gain**
  - The Cascade System will reach setpoint faster, but overshooting the setpoint may occur.
  - To reach the setpoint faster, increase the DHW Proportional Gain value by 2. Perform Cascade Autodetection and initiate a domestic hot water call. Observe the cascade response and make further adjustments if necessary.

- **Decrease DHW Proportional Gain**
  - The Cascade System will take longer to reach the setpoint, but setpoint overshooting is minimized.
  - If the setpoint is reached too quickly, decrease the DHW Proportional Gain value by 2. Perform Cascade Autodetection and initiate a domestic hot water call. Observe the cascade response and make further adjustments if necessary.

Default: 7

Please consult Triangle Tube’s technical Support before making any adjustments. Improper adjustment of DHW Proportional Gain could lead to temperature fluctuations and erratic cascade operation.

DHW Integral Gain allows the cascade response to be adjusted for a domestic hot water call. DHW Integral Gain has the greatest influence when the system temperature is close to the setpoint.

Adjust the DHW Integral Gain value using the LEFT or RIGHT keys, then store the setting with the OK key.

- **Increase DHW Integral Gain**
  - The Cascade System will take longer to reach the setpoint, but setpoint overshooting is minimized.
  - If the setpoint is reached too quickly, increase the DHW Integral Gain value by 2. Perform Cascade Autodetection and initiate a domestic hot water call. Observe the cascade response and make further adjustments if necessary.

- **Decrease DHW Integral Gain**
  - The Cascade System will reach setpoint faster, but overshooting the setpoint may occur.
  - To reach the setpoint faster, decrease the DHW Integral Gain value by 2. Perform Cascade Autodetection and initiate a domestic hot water call. Observe the cascade response and make further adjustments if necessary.

Default: 245

Please consult Triangle Tube’s technical Support before making any adjustments. Improper adjustment of DHW Integral Gain could lead to temperature fluctuations and erratic cascade operation.

CHAPTER 9 - MODBUS INTERFACE

The Modbus Interface allows a Building Management System (BMS) to directly connect to the appliance. A BMS can read information from the boiler to determine its operating state, lockout status, sensor readings, etc. A BMS can also operate the boiler by providing a setpoint.

Additional quality water heating equipment available from Triangle Tube

Maxi-Flo Pool and Spa Heat Exchangers

- Constructed of high quality corrosion resistant stainless steel (AISI 316) or titanium
- Specially designed built-in flow restrictor to assure maximum heat exchange
- Compact and light weight
- Available in 8 sizes to accommodate any size pool or spa

SMART Indirect Fired Water Heaters

- Exclusive Tank-in-Tank design
- Stainless steel construction
- Available in 7 sizes
- Limited LIFETIME residential warranty
- 6 Year limited commercial warranty
- Self cleaning/self descaling design

TTP Brazed Plate Heat Exchangers

- For domestic water, snow melting, radiant floor
- Plates made of stainless steel, with 99.9 % copper brazing, ensuring a high resistance to corrosion
- Self cleaning and self descaling
- Computerized sizing available from Triangle Tube
- Available in capacities from 25,000 BTU/hr to 5,000,000 BTU/hr
